Well-informed patients with well-defined visual needs and preferences should be provided with the TECNIS® Multifocal IOL. Models ZKB00 (+2.75 D) and ZLB00 (+3.25 D) are safe and effective, with significantly lower glare scores reported compared to monofocal lenses. Figure 5 shows mean differences in visual acuity across different lighting conditions for binocular subjects, with near acuity tested at 33 cm. Results were statistically higher than the FDA grid rate of 0.8%.

Subjects were asked about their desire to elect the same IOL again, if given the opportunity, with monofocal subjects generally expressing higher satisfaction rates, closer to "mostly satisfied," in general. Non-directed subject responses were obtained from the open-ended question "Are you satisfied with your vision?" with a 26.2% satisfaction rate for monofocal subjects, 50.3% for the TECNIS Multifocal IOL, and 51.3% for the Tecnis Symfony IOL.

Material: Soft foldable acrylic with a covalently bound UV absorber. The rate is the safety and performance endpoint. Van Swietenlaan 5
